# Full stack web development using python

HTML anchor

Saurabh Shukla (MySirG)

Agenda

① The anchor element
② Learn by examples

③ id

The anchor element

The **<a>** element with its **href** attribute creates a hyperlink to web pages, files, email address, locations in the same page or anything else a URL can address

```
<a href = "url"> Link text </a>
```

Learn by Examples

① Linking external page (page of other website)

② Linking web page of the same website

③ Linking a location on the same page.

id

You can set id of any html element, so that you will be able to refer it from elsewhere.

This is useful in many situations like moving to a new section within the current document.
